DSA Application Note

DSA behind Corporate Firewalls

The default DSA service is at https:\dsa-cloud.net running over port 80 and this is the minimum connection requirement for running a DSA player.

To allow full functionality of the DSA service access to the Pushy messaging service is required but for registration with this service and ongoing push notifications.

You can find out more about Pushy here : https://pushy.me/docs

From a firewall standpoint the following outgoing rules may be required:

- Port 80 (OUTGOING) access is required for the DSA-cloud.net connection / Pushy Registration service (https://pushy.me)
- HTTP Tunnelling access is required over the default Port 443 (OUTGOING) to the Pushy Service.
- Pushy uses the MQTT which in turn requires TCIP communications over Port 1883 (outgoing)
